Synthora

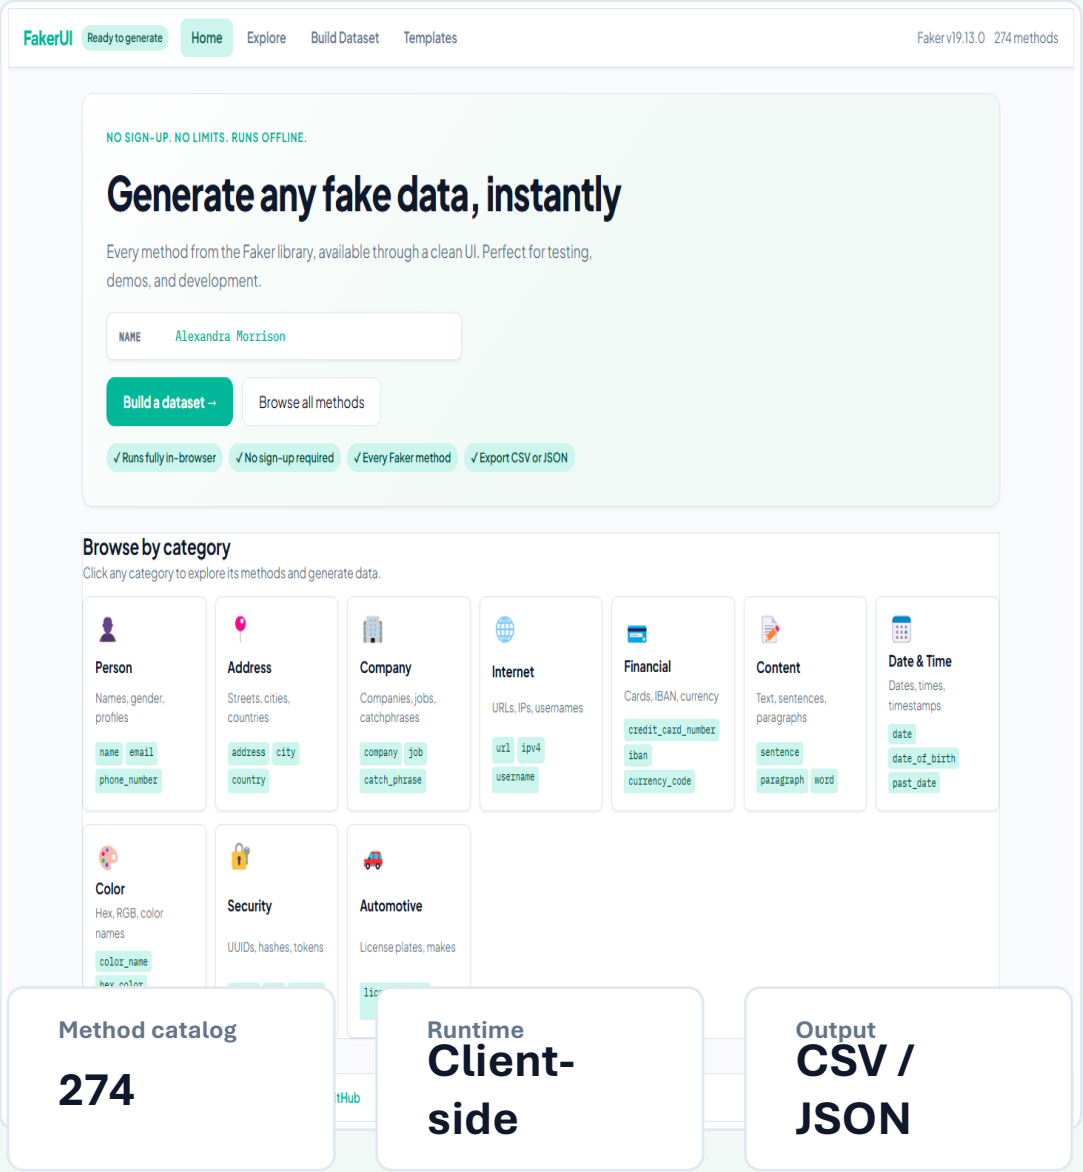
Synthetic data generation that feels like a product

Synthora gives developers, QA teams, and demo owners a fast path to realistic data without setup, signup, or backend infrastructure.

No signup | Runs in browser | JSON + CSV

Live demo

https://arvind3.github.io/Synthora/



WHY THIS MATTERS

Creating fake data is still more manual than it should be

The pain is rarely strategic, but it shows up in every test cycle, demo, and lower environment.

Manual setup

Spreadsheets, copied records, and one-off scripts slow teams down.

Privacy risk

Real customer data should not travel into demos or non-production workflows.

Low realism

Toy data breaks when teams need believable product scenarios.

Delay cost

Teams lose time before they can even start the real work.

- Developers need credible data fast, not another setup task.
- QA teams need repeatable synthetic datasets for regression and workflow validation.
- Demo teams need realistic records without using sensitive customer information.
- Non-technical users still need a guided path to export-ready data.

Synthora turns fake data from a coding chore into a product workflow

It gives teams a clear path from discovery to export using the browser alone.

Discover

Search the live Faker method catalog through a clean UI instead of raw code.

Build

Compose structured schemas with locale, rows, seed, and field mapping.

Preview

Inspect output before you download or hand it to another team.

Export

Take clean JSON or CSV into testing, demos, or downstream workflows.

- No signup required.
- No infrastructure to stand up.
- Client-side runtime execution.
- One workflow for technical and non-technical users.

Primary value
Fast, safe, self-serve

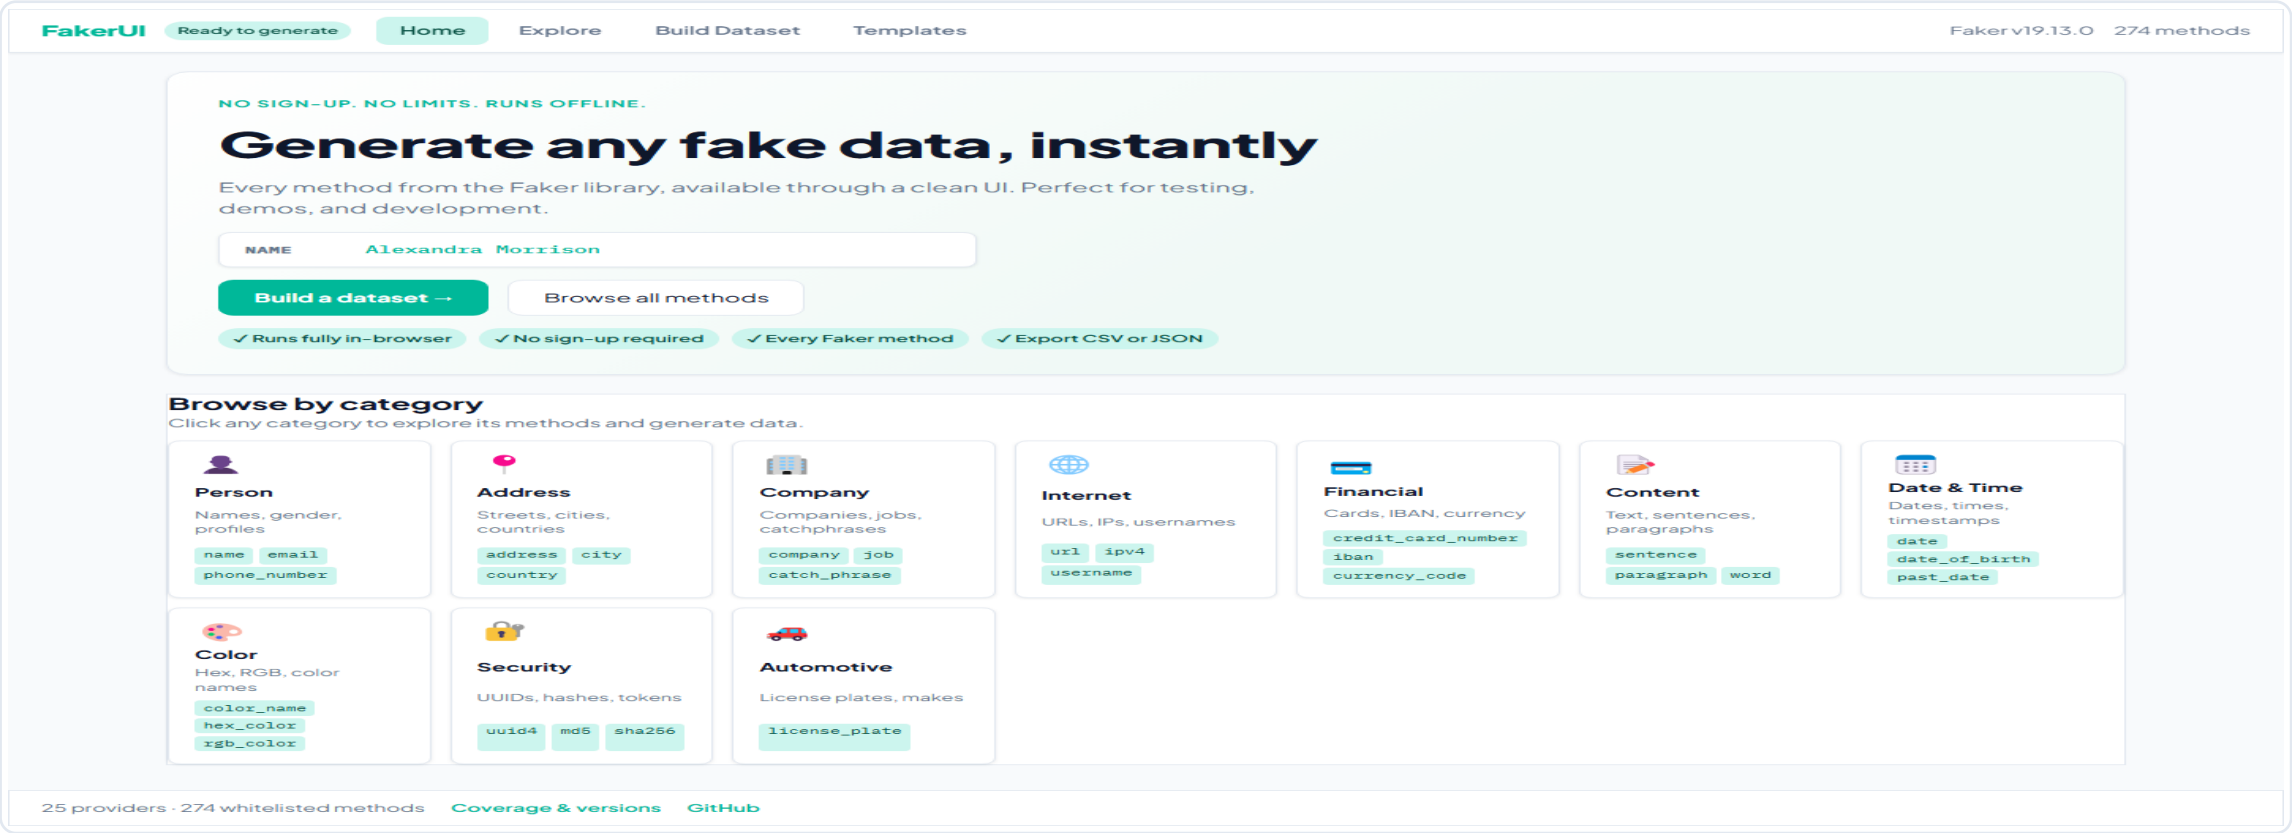
Delivery model
Static web app

Runtime model
Pyodide + Faker

Trust model
Whitelisted methods

The product value is visible in one screen

The homepage makes the workflow legible immediately: understand the promise, choose a path, start generating.



Build Dataset CTA

Jump directly into structured dataset creation.

Category Browser

Browse common data domains without learning library internals.

Runtime Signal

Clear status tells users when the browser runtime is ready.

Built for the data types teams use every day

The experience covers the high-value domains most often needed in testing, demos, and environment setup.

Person

Profiles, names, email, phone

Address

Street, city, country, postcode

Company

Organization, job, catch phrase

Internet

URL, IP, username, domain

Financial

Cards, IBAN, currency

Content

Sentence, paragraph, word

Date and Time

Dates, timestamps, birth dates

Security

UUIDs, hashes, tokens

This breadth matters because the product can support both quick samples and realistic multi-field datasets from the same UI.

The Schema Builder makes structured data a self-serve workflow

Users can choose fields, control rows, preview output, and export without leaving the page.

NO-CODE DATASET BUILDER

FakerUI Runtime ready | Home | Explore | Build Dataset | Templates | Faker v19.13.0 | 274 methods

Locale: en_US | Rows (1–5000): 100 | Seed: Optional integer

    "favorite_color": "Pink"
```

25 providers · 274 whitelisted methods | Coverage & versions | GitHub

Field Mapping

Each column is tied to a specific Faker method.

Generation Controls

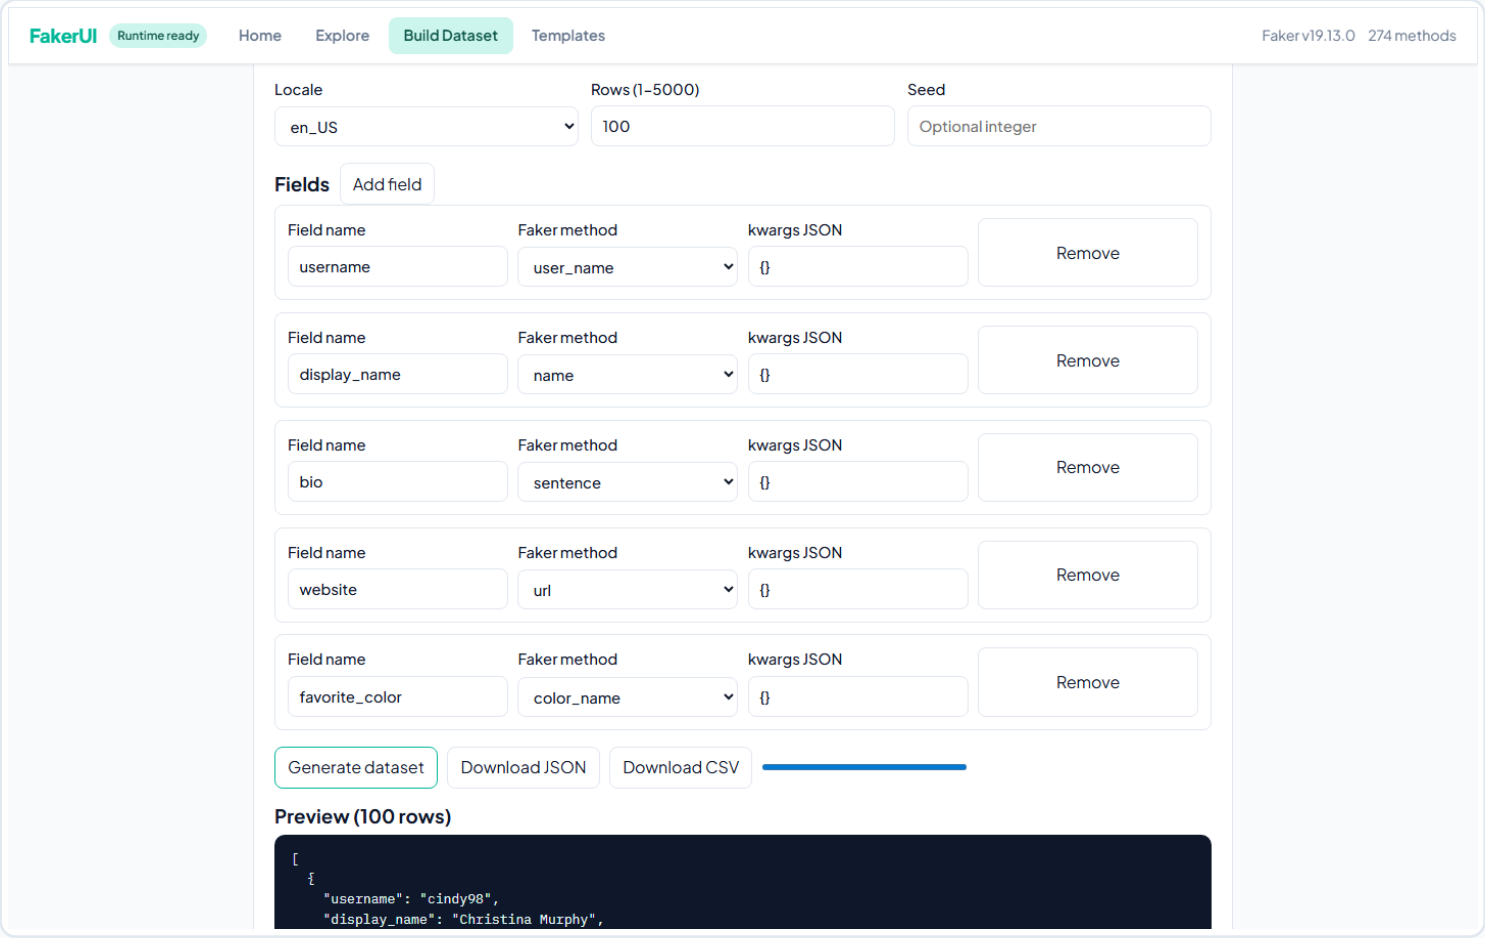
Locale, row volume, and seed make output more deliberate.

Preview Before Export

Inspect output before downloading JSON or CSV.

The last mile stays simple

Build the data once, then move it directly into the workflow that needs it.



JSON Export

Use it for API mocks, fixtures, seeded app state, and developer flows.

CSV Export

Use it for spreadsheets, imports, QA validation, and business-friendly handoff.

Operational Value

Generated files can feed automation, demo resets, and lower-environment setup.

Designed for speed, safety, and usability

The product reduces friction without reducing capability.

Fully Browser-Based

Static delivery with no backend dependency.

No Signup Required

Start immediately without account setup.

Searchable Method Catalog

Browse the active Faker surface through a guided UI.

Interactive Generation

Try methods and validate output before building full datasets.

Templates

Use starter schemas to move faster on common scenarios.

Export-Ready Output

Download JSON or CSV when the dataset is ready.

One workflow now serves developers, testers, and non-technical users with less coordination overhead.

Different teams get a clear outcome from the same product

The value changes by audience, but the workflow stays shared.

Developers

Generate realistic seed data faster and stop writing throwaway setup scripts.

QA and automation

Prepare repeatable synthetic datasets for regression and workflow validation.

Demo and product teams

Populate environments with believable records before customer or stakeholder reviews.

Non-technical users

Use a guided interface instead of learning a library API or writing code.

Platform and DevOps teams

Avoid standing up a separate internal service just to create sample data.

Shared outcome

Less setup friction.
Better realism.
Safer data.

Lightweight architecture, credible delivery model

The product keeps infrastructure minimal while preserving trust in what runs inside the browser.

React UI

Home, Explore, Templates, Build Dataset

>

Generated catalog and runtime manifest

>

Worker runtime

Execution isolated from the main thread

>

Pyodide + Faker

Python Faker runs in-browser

>

Preview + Export

Rows become preview, JSON, and CSV

- Build-time Python introspection generates catalog metadata and the runtime manifest.
- Only whitelisted methods are exposed, aligning product behavior with runtime enforcement.
- Generated rows remain in the browser session until the user previews or exports them.

Real-world use cases map directly to everyday delivery work

The value is practical, immediate, and easy to explain across teams.

API testing

Seed request payloads and mock response bodies.

Regression testing

Generate safe inputs for repeatable automation runs.

Product demos

Populate dashboards, tables, and flows before reviews.

Load and perf prep

Create bulk records for lower environments and test paths.

Training and sandbox data

Prepare synthetic examples for onboarding and enablement.

Schema prototyping

Shape sample datasets before backend contracts are final.

Why teams choose this over ad hoc scripts and generators

The difference is not just the library. It is the quality of the workflow.

- Fully client-side generation keeps data local to the browser session.
- No infrastructure or account model is required to start using the product.
- Open-source code and generated catalog metadata increase transparency.
- Whitelisted runtime execution improves trust in what the UI can actually do.
- The same experience supports both quick exploration and structured export.

Deployment model

Adoption model

Immediate self-service

The fastest proof is the product itself

A short live walkthrough communicates the value better than another feature list.

https://arvind3.github.io/Synthora/

Try first

Open Build Dataset and generate a simple schema.

Then explore

Search methods and use Try to validate the output shape.

What to show

Speed, simplicity, and export-ready output.

Clear next steps already exist

The current product solves core workflows, with obvious room for expansion.

API mode

Expose generation through a more automation-friendly interface.

Richer templates

Expand reusable datasets for QA, retail, CRM, and ITSM.

Tool integrations

Connect more directly with testing and developer workflows.

Relationships

Support linked datasets across related entities.

- Saved presets would help teams reuse common generation patterns.
- Governed sharing could make approved templates easier to distribute across organizations.
- Relational dataset modeling would open more advanced demo and testing scenarios.

Synthora makes realistic data generation feel fast, safe, and usable.

It replaces hidden setup work with a browser-first product workflow teams can adopt immediately.

- Safer than reusing real data.
- Faster than hand-building demo and test records.
- Accessible to technical and non-technical users.
- Ready for live use today.

Next step

Open the live product and build a dataset in under five minutes.
