Introducing Synthora

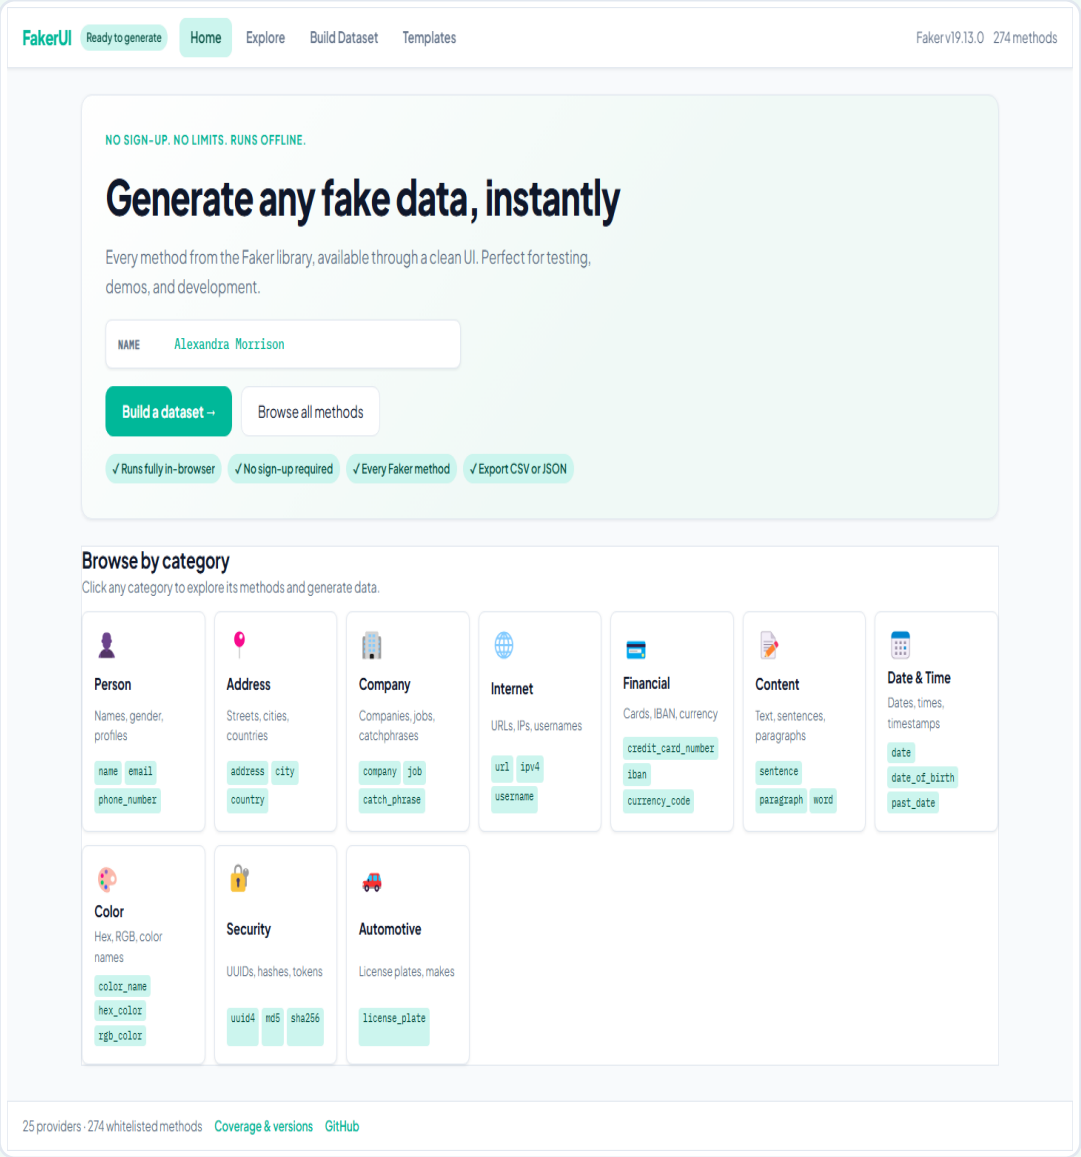
Synthetic data generation for modern product teams

Create realistic test data instantly. No signup. No backend. Just open the app and generate.

Methods	Runtime	Export
274	In-browser	JSON / CSV

Live product

https://arvind3.github.io/Synthora/



Teams still waste time building fake data by hand

And they should not have to.

Slow setup

Manual spreadsheets and throwaway scripts keep showing up before every test cycle and demo.

Risky source data

Real customer records should not leak into lower environments or presentations.

Weak realism

Lorem ipsum and toy data fail as soon as teams need believable products or workflows.

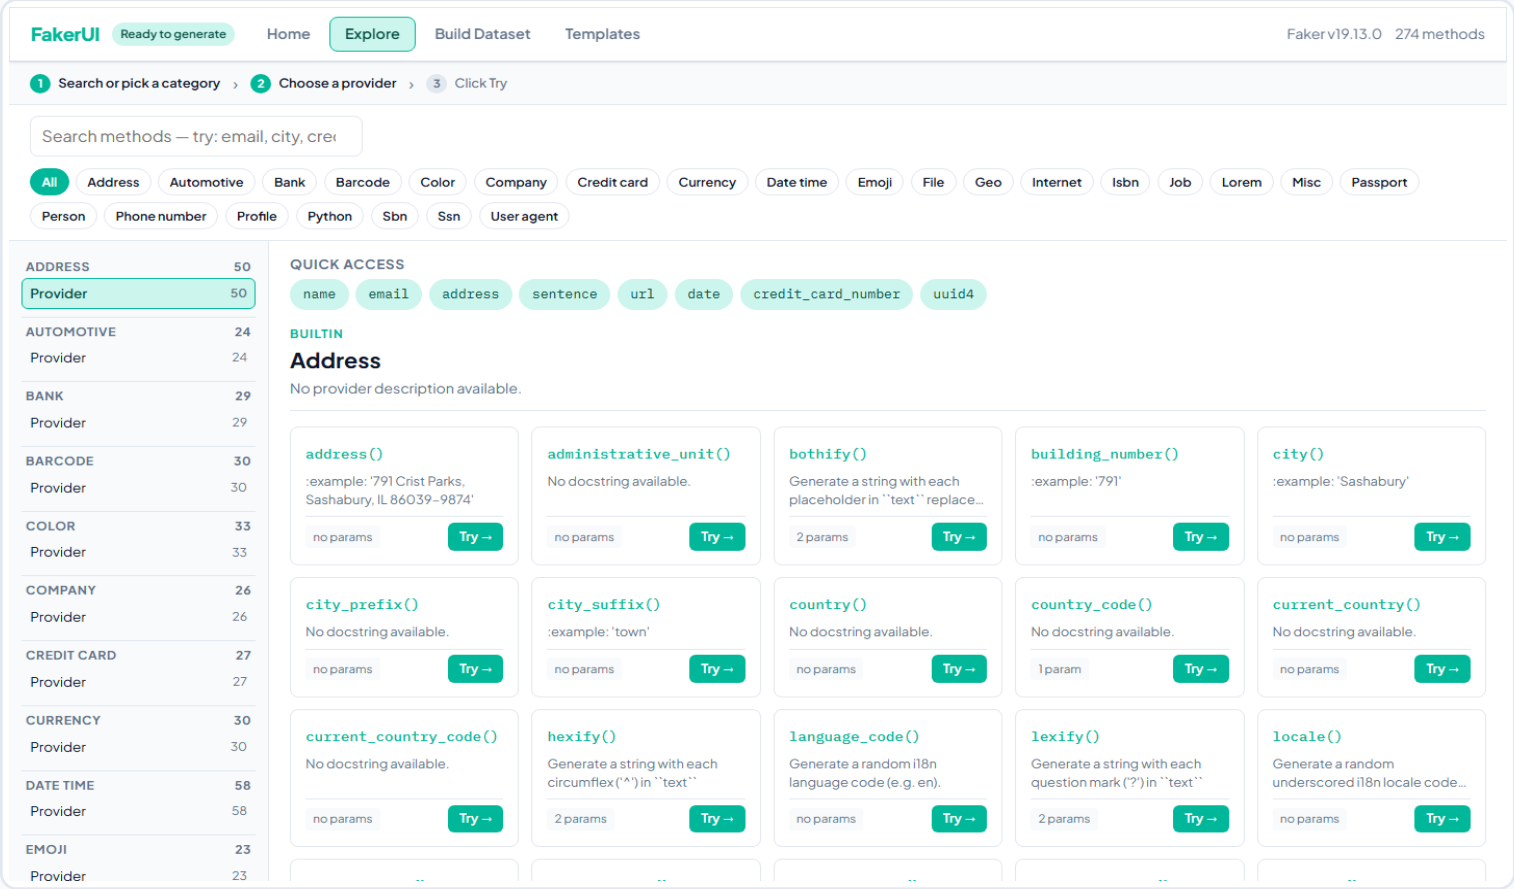
Fragmented tools

Library power exists, but the workflow is not accessible to everyone.

- Developers need speed.
- QA teams need repeatability.
- Demo teams need realism.
- Business users need simplicity.

Synthora packages Faker into a product experience

Search methods, build datasets, preview results, and export immediately.



Explore

Search providers and try methods from a modern UI.

Build

Assemble structured datasets with fields, locale, rows, and seed.

Export

Download usable JSON or CSV in the same workflow.

https://arvind3.github.io/Synthora/

From homepage to output in minutes

The product flow is intentionally short.

1. Home

Understand the product value and jump into action.

2. Explore

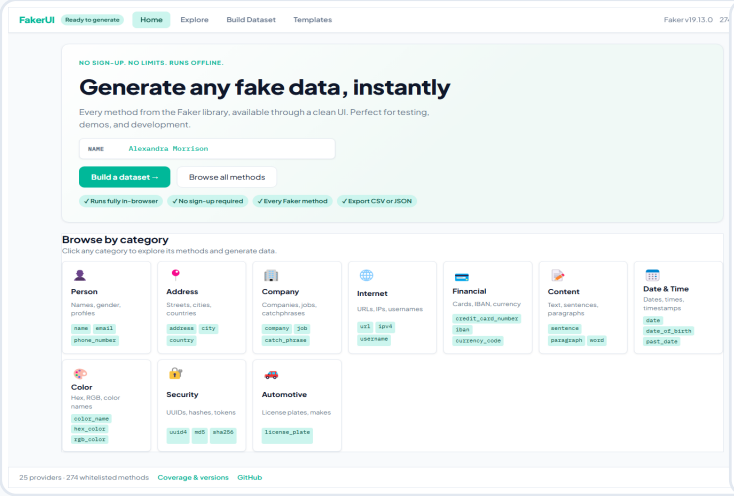
Browse categories and interact with individual Faker methods.

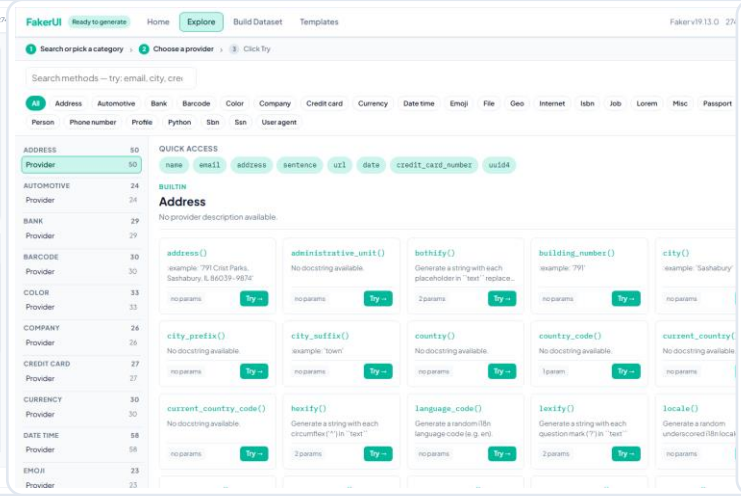
3. Build Dataset

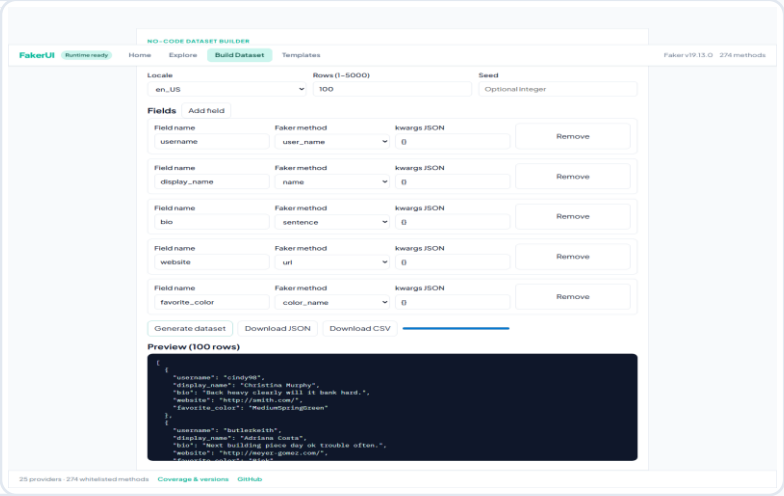
Compose schema fields and generate larger datasets.

4. Export

Take JSON or CSV into testing, demos, or workflows.







https://arvind3.github.io/Synthora/

Key benefits, by team

One launch, multiple audiences.

Developers

Generate believable seed data faster and avoid writing throwaway scripts.

QA and automation

Prepare repeatable synthetic datasets for validation and regression testing.

Demo teams

Populate product environments with safe but credible records before meetings.

Non-technical users

Use a guided interface without learning Faker APIs or code.

Platform teams

Avoid building and hosting a separate internal sample-data service.

Lightweight architecture, serious utility

Static delivery, browser execution, export-ready output.

React UI
Home, Explore, Templates, Build Dataset

>

Catalog
Generated metadata and runtime manifest

>

Worker
Execution isolated from the main UI thread

>

Pyodide + Faker
Python Faker runs in-browser

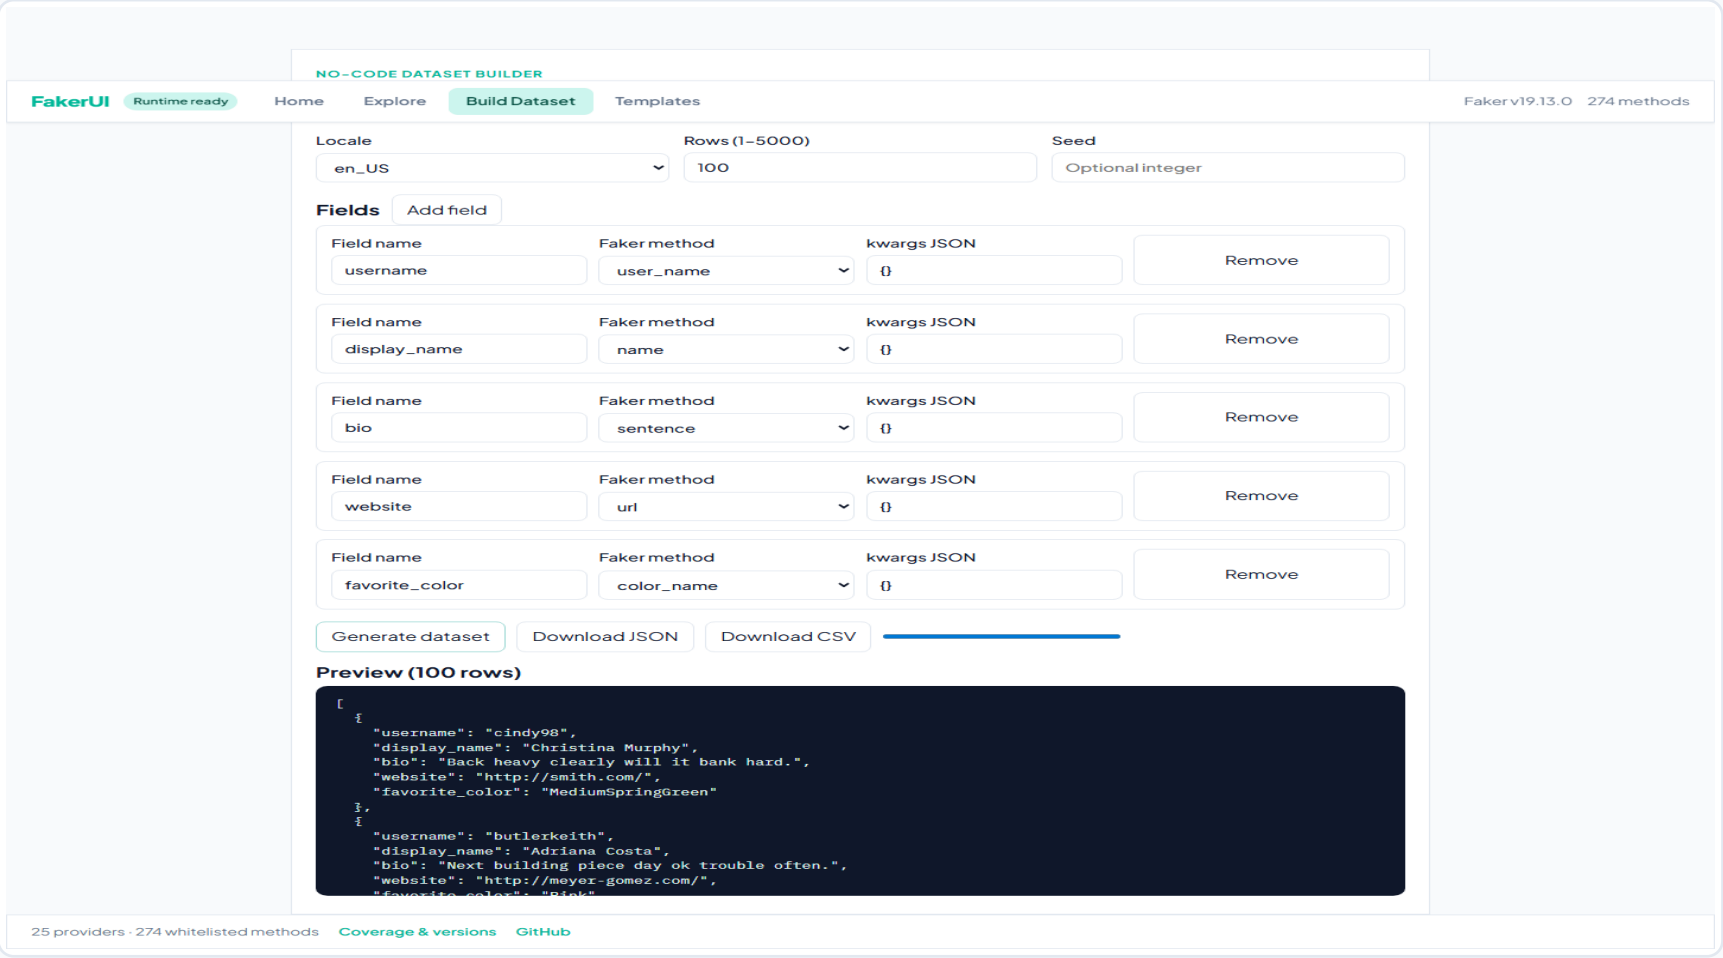
>

Export
Preview plus JSON / CSV output

- Build-time introspection generates the active catalog and whitelist.
- Runtime execution stays inside the browser.
- Generated data can be previewed and downloaded without infrastructure.

Dataset creation is the hero workflow

Build the shape you need, then export it.



Field mapping

Each column uses a chosen Faker method.

Control volume

Rows, locale, and seed support repeatable output.

Export cleanly

JSON and CSV are one click away.

https://arvind3.github.io/Synthora/

Launch use cases teams can adopt immediately

Synthora is useful on day one.

API testing

Seed payloads and mocked responses.

Regression testing

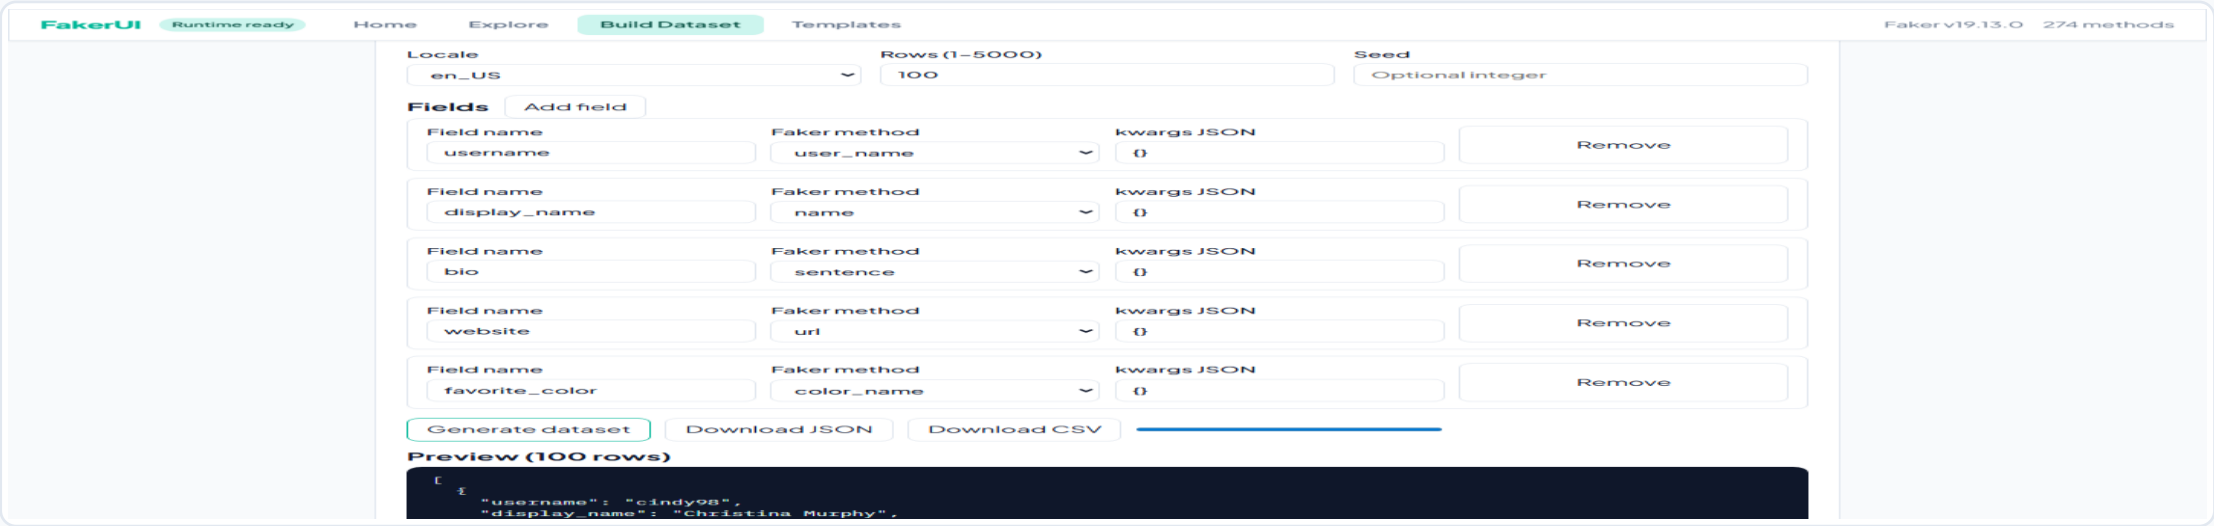
Prepare synthetic datasets for repeatable automation.

Product demos

Populate screens and tables before stakeholder reviews.

Training

Use safe examples in onboarding and sandbox flows.



https://arvind3.github.io/Synthora/

Why Synthora feels different from ad hoc data tooling

It combines speed, accessibility, and portability.

No infrastructure
Static site

No signup
Immediate use

Privacy-safe
Synthetic output

Open source
Extensible

- Fully client-side generation is a strong story for privacy and simplicity.
- The UI lowers the barrier for teams that do not want to work directly in code.
- The catalog and whitelist model gives the experience more trust and clarity.

Synthora is live

Try the product and share it with the teams who still handcraft fake data.

https://arvind3.github.io/Synthora/

Try first

Open Build Dataset and generate a schema.

Then explore

Search methods and use Try for fast samples.

Share it

Send the link to your engineering and QA teams.
